### ADDITIONAL MATERIALS

In addition to this examination paper, you will require a calculator and a **Data Booklet**.

### INSTRUCTIONS TO CANDIDATES

Use black ink or black ball-point pen.

Write your name, centre number and candidate number in the spaces at the top of this page.

Answer **all** questions.

Write your answers in the spaces provided in this booklet.

### INFORMATION FOR CANDIDATES

The total number of marks available for this paper is 80.

The number of marks is given in brackets at the end of each question or part question.

You are reminded of the necessity for good English and orderly presentation in your answers.

You are reminded to show all working. Credit is given for correct working even when the final answer given is incorrect.

1. A heavy sledge is pulled across a level snowfield by a force  $F$  as shown. To keep the sledge moving at constant velocity a **horizontal** force component of 200 N is required.

(a) Calculate the force  $F$  needed to produce a horizontal component of 200 N on the sledge. [2]

.....

.....

(b) (i) Define *work done* and use this definition to explain why no work is done in the vertical direction. [3]

.....

.....

.....

.....

.....

(ii) It takes 30 minutes to pull the sledge a distance of 2.0 km across level ground. Calculate

(I) the work done; [2]

.....

.....

(II) the mean power needed. [2]

.....

.....

- (c) Assume the force  $F$  calculated in (a) is now applied horizontally as shown. Calculate the initial acceleration of the sledge given that its mass is 40.0 kg and assuming that the frictional force stays the same. [3]

.....

.....

.....

.....

2. A student uses the circuit below to produce a current-voltage graph for a 12 V, 24 W filament lamp.

(a) Show clearly on the diagram the correct positions for the voltmeter and ammeter. [2]

(b) When the lamp is working normally, calculate

(i) the current flowing through it; [1]

.....

.....

.....

(ii) its resistance. [1]

.....

.....

.....

(c) The value of  $R$  is chosen so that the voltage across the lamp can be varied between 0 V and 12 V. The circuit below shows the position of the moveable contact when the lamp is operating normally (i.e. at 12 V).

Calculate the required value of  $R$ . [4]

.....

.....

.....

.....

.....

.....

.....

(d) Sketch on the axes below the current-voltage graph expected for the filament lamp. [2]

3. (a) What name is given to the turning effect of a force? [1]

.....

(b) (i) A simple toy mobile, consisting of a star and a triangle is shown hanging freely. Assume the rod AB is weightless. Calculate the weight of the triangle. [2]

.....

.....

.....

.....

.....

.....

.....

.....

(ii) Hence calculate the tension in the thread attached to the ceiling. [1]

.....

.....

(c) The mobile is now attached to another weightless rod CD of length 0.80 m, making a more complex mobile as shown. A sphere of weight 9.0 N is attached to D and the mobile is hung freely from the ceiling.

- (i) The distance  $x$  can be adjusted to allow the rod CD to hang horizontally. Calculate  $x$ . [3]

.....

.....

.....

.....

.....

- (ii) The original star and triangle mobile is now replaced with a single 'crescent moon' of weight 12.0 N as shown. Explain whether  $x$  will now have to increase, decrease or stay the same to keep CD horizontal. [2]

4. (a) A velocity-time graph is given for a body which is accelerating in a straight line.

(i) Using the symbols given on the graph, write down an expression for the gradient and state what it represents. [2]

.....  
.....  
.....

(ii) Using the symbols given on the graph, write down an expression for the area under the graph and state what it represents. [2]

.....  
.....  
.....

(iii) Hence or otherwise show clearly that, using the usual symbols,

$$x = ut + \frac{1}{2}at^2 \quad [2]$$

.....  
.....  
.....  
.....

(b) A cyclist accelerates **from rest** with a constant acceleration of  $0.50 \text{ m s}^{-2}$  for 12.0 s. Calculate

(i) the distance travelled in this time; [2]

.....  
.....  
.....

(ii) the maximum velocity attained. [2]

.....  
.....  
.....

(c) After 12.0 s, the cyclist stops pedalling and ‘freewheels’ to a standstill with constant deceleration over a distance of 120m.

(i) Calculate the time taken for the cyclist to decelerate to a stand-still. [2]

.....  
.....  
.....

(ii) Calculate the magnitude of the cyclist’s deceleration. [2]

.....  
.....  
.....

- (d) Draw an acceleration-time graph on the grid below for the **whole of the cyclist's journey**. [4]

- (e) In reality the cyclist would not slow down with constant deceleration. This is because the total resistive force acting on the cyclist consists of a constant frictional force of 8.0 N **and** an air resistance force which is proportional to the square of the cyclist's velocity.

- (i) When the cyclist was travelling with maximum velocity, the total resistive force acting was 165 N. Calculate the force of air resistance at this velocity. [1]

.....

- (ii) Hence calculate the total resistive force acting when the cyclist is moving at half the maximum velocity. [2]

.....

.....

.....

5. (a) Starting from a relevant equation, show that the unit of resistivity is  $\Omega \text{ m}$ . [2]

.....  
.....  
.....

(b) A cable consists of 14 strands of copper wire, each of **diameter** 1.3 mm.

(i) Show that the cross-sectional area of **one** strand of the copper wire is approximately  $1.3 \times 10^{-6} \text{ m}^2$ . [1]

.....  
.....

(ii) Hence calculate the resistance of one strand of length 20.0m. [1]  
[Resistivity of copper =  $1.7 \times 10^{-8} \Omega \text{ m}$ ].

.....  
.....

(iii) Determine the combined resistance of the 14 strand cable. [2]

.....  
.....  
.....  
.....

(iv) Showing your working clearly, calculate the ratio:

$$\frac{\text{Energy dissipated in one second in a **single strand** carrying a current of 3.0 A}}{\text{Energy dissipated in one second in the **whole cable** carrying a current of 3.0 A}}$$
 [3]

.....

.....

.....

.....

.....

.....

(v) Give an advantage of the 14 strand copper cable over

(I) a single strand copper cable of 1.3 mm diameter, [1]

.....

.....

(II) a solid core cable of the same total cross-sectional area. [1]

.....

.....

- (c) Consider **one** strand of length 20.0 m as shown. The strand contains  $2.0 \times 10^{24}$  free electrons.

- (i) Calculate the number of free electrons per unit volume in this wire. [1]

.....  
.....  
.....

- (ii) Hence calculate the mean drift velocity of electrons in the strand when there is a current of 3.0 A in it. [2]

.....  
.....  
.....

- (iii) Determine the mean drift velocity in the whole (14 strand) cable when there is a current of 3.0 A in it. [3]

.....  
.....  
.....  
.....  
.....  
.....

6. (a) An equation which can be applied to a cell of emf  $E$  and internal resistance  $r$  is

$$V = E - Ir$$

(i) What does  $V$  represent? [1]

.....

.....

(ii) What does  $Ir$  represent? [1]

.....

.....

(b) A voltmeter connected across the terminals of a cell reads 2.4 V. An ammeter (whose resistance is zero) reads 6.0 A when connected briefly across the cell.

(i) Write down the emf of the cell. [1]

(ii) Calculate the internal resistance of the cell. [1]

.....

.....

(iii) Give one reason for not leaving the ammeter connected to the cell. [1]

.....

.....

(c) Calculate the current through a  $2.0\Omega$  resistor when it is connected across the cell. [2]

.....

.....

.....

(d) Determine the number of cells of this type which, when connected in series with the  $2.0\Omega$  resistor, will produce a current of  $3.0\text{ A}$ . [4]
