UNIVERSITY OF CAMBRIDGE INTERNATIONAL EXAMINATIONS GCE Advanced Subsidiary Level and GCE Advanced Level

MARK SCHEME for the May/June 2012 question paper

for the guidance of teachers

9702 PHYSICS

9702/32

Paper 3 (Advanced Practical Skills 2), maximum raw mark 40

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes must be read in conjunction with the question papers and the report on the examination.

• Cambridge will not enter into discussions or correspondence in connection with these mark schemes.

Cambridge is publishing the mark schemes for the May/June 2012 question papers for most IGCSE, GCE Advanced Level and Advanced Subsidiary Level syllabuses and some Ordinary Level syllabuses.

(f)

	(i) Limitations 4 max.	(ii) Improvements 4 max.	No credit/not enough
A	two results not enough	take more readings <u>and plot a graph/</u> calculate more <i>k</i> values and <u>compare</u>	'repeat readings' on its own/ few readings/ take more readings and (calculate) average <i>k</i> / only one reading
В	difficult to form a perfect sphere or disc/diameter of sphere or disc varied	method to make uniform spheres/discs e.g. moulds	pre-sized spheres/ repeat diameter measurement and average
С	reason for difficulty in measuring <u>d</u> e.g. viewed through ruler/parallax error in <u>d</u>	method to improve measurement of <u>d</u> e.g. travelling microscope	eyes in line
D	difficult to pull newton-meter parallel to ruler/bench	method to ensure force is parallel to ruler e.g. use a long string/pulley and weights*	
E	difficult to judge reading on <u>newton-meter</u> when detaches with reason e.g. ruler moves suddenly/without warning (so difficult to read newton-meter at the instant the ruler starts to move)/force drops to zero immediately after detachment	method to <u>read force</u> at detachment e.g. newton meter with a 'max hold' facility/video and playback or freeze frame/ use system of pulley and weights or sand to measure <i>F</i> */ use force sensor and datalogger or computer*	video to take reading/ digital (electronic) newton meter/ parallax related to newton meter/ difficult to measure force/ issue of viewing ruler and meter simultaneously
F	contact area less than calculated disc area/bulging disc		
G	difficult to zero newton-meter when used <u>horizontally</u>	improved method to measure <i>F</i> : e.g. use system of pulley and weights or sand*/use force sensor with datalogger or computer*	zero error in newton-meter/ just a pulley

Do not allow: reaction time/human error/using vernier caliper/helpers/use of micrometer screw gauge/effect of temperature/change in stickiness of Blu-Tack.

*This answer can be credited as D, E or G (but not more than once).
